

Task 5: Logistic Regression - Solution Report

Objective:

Implement Logistic Regression for binary classification using the Breast Cancer dataset.

Dataset Used:

Breast Cancer dataset from Scikit-learn.

Steps Completed:

Data loading, preprocessing, train-test split, feature scaling, model training, prediction, and evaluation.

Evaluation Metrics:

Accuracy Score, Confusion Matrix, and Classification Report were used.

Result:

Logistic Regression produced high classification accuracy and successfully demonstrated binary classification.

Conclusion: This task improved understanding of supervised learning and Logistic Regression implementation.
